

MKONO GLOBAL

Execution as a Service

Probability of Success

An Honest Assessment for the Founding Team

May 2026 | Confidential

THE PREMISE OF THIS DOCUMENT

This is not a motivational document. It is not a pitch deck. It is an honest, realistic assessment of where Mkono Global stands, what the probability of success looks like at different levels, why those probabilities are unusually high compared to most startups, and what determines whether they go up or down.

Honesty is non-negotiable. If we cannot be honest with ourselves, we cannot protect what we have built.

Where MG Stands Right Now

Before assessing probability, it is important to state clearly what already exists. This is not an idea. This is not a prototype. This is not a plan. This is a business.

WHAT EXISTS TODAY

- **500+ verified orders completed** with a 100% success rate and zero orders lost
- **3+ years of manual operations testing** -- every route, every supplier, every M-Pesa verification, every Sacco delivery, every WhatsApp coordination flow
- **75+ consecutive months of medication delivery** to the same patient without a single failure
- **22+ service categories proven in production** -- groceries, school fees, medication, eyeglasses, construction materials, government errands, gifts, property verification, business consultation, and more
- **Real revenue** -- KES 2,500 execution fee per order, real money from real clients paying for real services
- **Operational infrastructure built on existing systems** -- M-Pesa, WhatsApp, 2NK/4NTE Saccos, Glovo, Uber, boda boda, trusted supplier partnerships -- zero capital infrastructure investment
- **Remote execution capability proven** -- team in Ruiru executing orders in Nyeri (100+ km away), supermarket partnerships, Sacco transport delivering 500km in 2-3 hours
- **A mobile app in active development** -- complete product specification, brand guidelines, and developer engaged
- **Founders who lived the problem** -- \$50,000 lost personally before building the solution. Not guessing. Not theorizing. Solving their own pain.

Most startups at this stage have: a pitch deck, maybe a prototype, zero revenue, zero proven operations, and a hypothesis about what customers want. MG has a functioning business with proof.

The Probability Assessment

Genuinely honest and realistic. If MG executes with discipline and does not lose its identity:

Stable, Profitable, Respected Business

70%

A company that generates consistent revenue, serves a loyal client base, employs a team, and is recognized within diaspora communities as the trusted execution service.

Major Diaspora Brand Across Multiple Countries

40-50%

Mkono Global becomes the name Kenyans across the USA, Canada, UK, and beyond associate with diaspora execution. "Mkono it" enters the vocabulary. Multi-country operations, thousands of monthly orders.

Very Large African Infrastructure Company

15-25%

Mkono Global becomes diaspora trust infrastructure -- not just for Kenyans but for Nigerians, Ghanaians, Ethiopians, and other African communities. The model expands. The brand becomes pan-African.

Billion-Dollar Company

5-10%

Mkono Global becomes a category-defining global company -- the first trusted execution infrastructure for all diaspora communities worldwide. Institutional partnerships, API ecosystem, financial products built on the trust layer.

Why These Probabilities Are Unusually High

The average startup has roughly a 10% chance of surviving past year 3 and a 1% chance of becoming a significant company. MG's probabilities are dramatically higher. Here is why -- honestly assessed against what actually exists, not what is hoped for:

1. THE PROBLEM IS REAL AND EMOTIONAL

This is not a convenience problem ("I wish food delivery was faster"). This is a pain problem ("I cannot sleep because I do not know if my mother's medication was bought"). Emotional problems create deep customer loyalty because solving them feels personal, not transactional. MG is not competing for attention. It is relieving anxiety. People do not churn from companies that relieve anxiety.

2. THE FOUNDERS LIVED THE PAIN PERSONALLY

\$50,000 lost over years of sending money home. Brothers who redirected funds. Mothers who did half the shopping. Contractors who inflated prices. Nieces sent home because school fees were never paid. The founders did not discover this problem through market research. They carry the scars. That creates operational intuition no hired CEO can replicate -- the instinct to redirect pocket money to a sister's eye medication because health comes first, and then send a KES 896 reconciliation invoice instead of absorbing or ignoring it. That judgment comes from lived experience, not training.

3. OPERATIONS WERE TESTED BEFORE SOFTWARE

This is extremely rare. Most startups: raise money, build an app, then hope customers appear. MG: manually tested workflows for 3+ years, verified suppliers, handled real deliveries, managed real payments, built trust order by order. The app is being built to organize and scale what already works -- not to test whether something might work. This eliminates the single biggest startup killer: building something nobody wants. MG already knows people want it because they are already paying for it.

4. REAL CUSTOMERS AND REAL TRANSACTIONS ALREADY EXIST

500+ orders. Real money. Real groceries in real kitchens. Real medication in real hands. Real school fees stamped and paid. Real eyeglasses on a sister's face. Real text messages: "Hi bro nilizichukua saii naendelea vizuri nashukuru." This is not a hypothesis. This is a track record. Most startups at the app-building stage have zero customers. MG has repeat customers, referral networks, and operational proof.

5. THE MODEL IS ASSET-LIGHT

No warehouses. No fleet. No inventory. No office lease required. No expensive licenses. No heavy infrastructure. The team coordinates using tools that already exist and cost almost nothing: M-Pesa (free to verify), WhatsApp (free to communicate), Saccos (cheap to transport), Glovo/Uber (on-demand), supplier partnerships (per-order). Revenue comes from the KES 2,500 execution fee. Costs are marginal per order. The business can be profitable from day one -- and it already is. This means MG does not need to burn investor cash to survive. That independence is strategically powerful.

6. THE TRUST MOAT IS CULTURALLY DEEP

Trust in African diaspora communities is relationship-driven, not brand-driven. Once a family trusts Mkono Global with their mother's medication, that trust is embedded emotionally. Switching to a competitor feels like betraying a relationship, not changing a vendor. This creates natural retention that no feature, no discount, and no marketing campaign can break. The trust moat deepens with every successful order -- it compounds, like interest. After 75 months of medication delivery, that patient's family will never switch. Ever.

7. WORD-OF-MOUTH GROWTH IS THE CHEAPEST ENGINE IN THE WORLD

MG does not need paid ads. One satisfied customer creates: family referrals, friend referrals, church and community referrals, diaspora network referrals, repeat orders, and social proof. The completion receipt

forwarded in a family WhatsApp group -- a photo of grandmother holding her groceries, a stamped school fee receipt, a sister's text about her eyeglasses -- is more powerful than any advertisement. People naturally talk about who helped their family, who delivered reliably, who can be trusted back home. That is organic growth driven by emotional meaning, not marketing spend.

8. THE OPERATIONAL REALITY OF KENYA IS ITSELF A MOAT

Paybill numbers displayed on physical signs inside stores. Google Maps that does not work for last-mile delivery. WhatsApp location PINs instead of street addresses. M-Pesa prompting that requires verifying the business name on screen. Sacco transport networks with offices in every town. Boda boda for non-fragile, Uber car for eggs. This operational knowledge took 3+ years to accumulate. A competitor in San Francisco or London cannot navigate this from abroad. They would need to build everything MG has already built -- and they would have failures along the way. MG had zero.

Why It Is Not Guaranteed

Honesty requires saying this clearly: **nothing is guaranteed**. The probabilities above are high compared to startups, but they are not certainties. Here is what can go wrong -- and each one has the power to drop the probabilities sharply.

THE SCALING TRAP

The dangerous stage is no longer startup. The dangerous stage is: **scaling without losing quality and trust**. This transition kills many companies. When agents increase from a handful to 20, then 50 -- will the 100% success rate hold? When the founders cannot personally review every order -- will the green-light decisions still be made with the same judgment? When order volume grows from 50 per month to 500 -- will every order still feel like a promise to a family, or will it start feeling like a queue?

If quality holds during scaling, the probabilities stay high. If quality slips, they drop fast.

THE IDENTITY TRAP

Success attracts outside voices. Investors will want faster growth. Advisors will push toward "becoming a platform." Partners will want features. Competitors will tempt you to compete on speed or price. Every one of those conversations pulls MG away from what makes it special: simplicity, human judgment, emotional trust, and the willingness to redirect pocket money toward a sister's health and send a KES 896 reconciliation invoice.

If MG protects its identity, the probabilities hold. If it chases what it is not, they collapse.

THE FOUNDER TRAP

US side versus Kenya side. Different daily realities. Scaling pressure. Money. Stress. Different visions for growth. Different tolerance for risk. The emotional weight of running a company that handles other families' most vulnerable moments. Many brilliant African businesses die not because the market rejected them but because the founders' alignment broke.

If the founders stay aligned, the probabilities are protected. If the relationship fractures, everything built on top of it fractures too.

THE COMPLACENCY TRAP

The app launches. Orders come in. Systems work. Revenue grows. And slowly, imperceptibly, the team stops feeling the orders. An order becomes a queue item instead of a grandmother's groceries. A verification step gets skipped because "we always use this supplier." A beneficiary call gets replaced by an automated notification. The human layer that IS the product quietly erodes -- not in one dramatic moment, but in a hundred small shortcuts over months.

If discipline holds, the probabilities remain. If shortcuts accumulate, the 100% success rate breaks -- and with it, the foundation of every referral.

The Multiplier: What Increases the Probabilities

The probabilities above are not fixed. Specific actions can push them higher:

Action	Why It Increases Probability	Impact
App launches successfully with WhatsApp-first architecture	Creates a permanent professional gap between MG and informal competitors. Makes the service scalable. Makes proof delivery instant and branded.	All levels increase by 10-15%
First 1,000 app orders completed at 99%+ success rate	Proves the system works at scale. Generates massive word-of-mouth. Creates an unchallengeable track record.	Level 1 moves toward 85%+
Expansion to UK and Canada with same quality	Proves the model is not US-only. Opens two new diaspora markets. Creates multi-country momentum.	Level 2 moves toward 60%
Premier Services generates high-value business consultation revenue	Proves MG can serve the high end, not just transactional orders. Higher margins. Deeper client relationships.	All levels increase
Recurring/subscription orders (monthly medication, weekly groceries)	Creates predictable revenue. Deepens trust through consistent delivery. Reduces customer acquisition cost to zero for repeat clients.	Level 1 becomes near-certain

Systematic story capture and community marketing	Turns every completed order into a referral engine. The eyeglasses story, the Nyeri supermarket story, the eggs in the Uber -- each one brings 3-5 new clients.	Accelerates growth at all levels
Decision playbooks enable non-founder agents to make quality judgments	Breaks the founder bottleneck. Allows scaling without proportional quality loss. Most critical for levels 2-4.	Enables all higher levels
Nigerian, Ghanaian, or Ethiopian diaspora pilot	Proves the model works beyond Kenya. The African diaspora is not just Kenyan. If the trust-and-execution model translates, the addressable market expands 10x.	Level 3 moves toward 30-40%

The Reducer: What Decreases the Probabilities

Event	Why It Decreases Probability	Impact
First failed order that is hidden or mishandled	Breaks the trust foundation. Bad news in diaspora WhatsApp groups travels faster than good news. One screenshot of a failed order can undo years of trust.	All levels drop 15-25%
Founder disagreement that becomes public or operational	Paralyzes decision-making. Creates factions in the team. Confuses the market. Erodes internal culture.	All levels drop 20-30%
Rapid scaling with undertrained agents	Success rate drops below 95%. Multiple failures cluster. Reputation damage compounds. Recovery becomes harder with each failure.	Level 1 drops to 40-50%
Chasing investor money and losing operational focus	Growth metrics replace trust metrics. Speed replaces quality. The 3-day window shrinks. The human touch disappears. MG becomes "just another app."	All levels drop sharply
Competitor with diaspora founder + ground operations emerges	The only external threat that is genuinely dangerous. If they execute well, they split the market.	Levels 2-4 drop 10-15%

The Honest Comparison

To put MG's position in perspective:

Metric	Average Startup	Mkono Global
Product-market fit	Searching for it	Already proven across 500+ orders
Revenue	Pre-revenue or minimal	Real paying customers, real execution fees

Customer validation	Surveys, interviews, assumptions	"Hi bro nilizichukua saii naendelea vizuri nashukuru"
Operations	Theoretical, untested	3+ years manually tested, zero failures
Team	Co-founders + maybe 1-2 hires	Founders + trained ground agents + supplier network + Sacco partnerships
Technology	Usually built first	Being built last -- to organize what already works
Capital required	Usually \$500K-\$2M to reach product-market fit	Near zero -- asset-light model already profitable
Growth engine	Paid ads, growth hacks	Word-of-mouth through diaspora trust networks -- free
Competitive moat	Usually technology (easily copied)	Trust, relationships, operational knowledge, cultural understanding (nearly impossible to copy)
Founder connection to problem	Often academic or observational	\$50,000 in personal losses. Scars, not spreadsheets.

"MG has a significantly higher probability of success than the average startup, mainly because it already behaves more like an operating business than an experimental idea."

The Final Honest Word

The probabilities are real. They are unusually high. But they are not automatic.

70% chance of becoming a stable, profitable, respected business means there is a 30% chance it does not happen. 40-50% chance of becoming a major diaspora brand means there is a 50-60% chance it stays local. Those numbers are honest. They should create urgency, not comfort.

The single most important variable is not the market, not the technology, not the competition, and not the funding. It is this:

THE DETERMINING VARIABLE

Can MG preserve the soul of the company while scaling operationally?

Can the green-light decision survive beyond the founders' personal involvement?

Can the 100% success rate hold at 5,000 orders?

Can new agents feel the weight of each order the way the founders do?

Can the company say "that is not in the invoice -- but her health comes first" at scale?

If yes: the probabilities hold. The company grows. The trust compounds. The brand becomes permanent.

If no: the probabilities decay. The company becomes another app. And delivery companies are replaceable.

The founders already know this. They wrote it into the product specification. They built it into the threat assessment. They ask the four questions constantly: What already works? What behavior already exists? How do we simplify? How do we protect trust?

The probability of success is high because the founders are the kind of people who ask those questions.

The probability stays high only if they never stop asking.

"We lived the problem first. We tested operations manually. We validated execution repeatedly. Now software will organize and scale what already works."

If that sentence remains true, the probability of success remains high.

If MG ever stops being able to say it honestly, the probability drops.

Protect the trust. Protect the standard. Protect who we are.
